

Seating & Asset Management, end to end

A one-page map of the two everyday flows: managing **where people sit** and tracking **the things the office owns**. Follow the numbered stages left to right. Chips show *who* does each step.

Admin

- Manages floor plans, seats and layout
- Sets floor **Properties** — area & cost
- Approves / rejects seat requests
- Assigns department colours
- Runs assets, movements & verification

Employee

- Views their own seat & the floor map
- Requests a seat **change** or **swap**
- Books meeting rooms
- Tracks the status of their requests
- No admin or approval controls

Switch roles any time from the **Admin / Employee** toggle in the top bar.

MODULE A Seating & Workplace

From an employee's seat request to the map updating — and everything Admin controls around it.

1

EMPLOYEE

See my seat

Open **My Seat** to view your current seat, floor and zone — or find it on the floor map.

2

EMPLOYEE

Request change / swap

Ask for a vacant seat, or a swap with a colleague. Add a reason and remarks, then submit.

3

SYSTEM

Admin notified

The request lands in Admin's **Seat Requests** inbox and an email-style alert is sent.

4

ADMIN

Approve or reject

Admin reviews the details. **Approve** and the map updates automatically; **reject** with a reason.

5

EMPLOYEE

Seat updates

On approval the seat is reassigned (swaps exchange both) and the employee is notified of the outcome.

Admin also runs the floor directly. Allocate, move, block or maintenance any seat · edit the layout (rooms, walls, seats) · set **Floor Properties** (carpet + super built-up area, rental, maintenance, overhead & misc cost) · colour the map by **department** · and track **Meeting Rooms** — availability, bookings, a utilization chart, and a “still using this room?” prompt that frees idle bookings.

● Vacant

● Occupied

● On notice

● Maintenance

● Blocked

MODULE B Asset Management

A simple, traceable record of every asset — classified, assigned, imaged and tracked from deployment to disposal. No QR, no clutter.

1

ADMIN

Classify & register

Add the asset under a category (**Tangible / Intangible / Land & Building**) and subcategory, with a unique Asset ID.

2

ADMIN

Assign & deploy

Set the assigned person, office/location and responsible person, and capture a **deployment image**.

3

RESPONSIBLE

Track & update

Keep status, remarks and a **current image** up to date through the asset's working life.

4

RESPONSIBLE

Flag defective

If damaged or proposed for disposal, upload a **defect image** + remarks for Admin review.

5

ADMIN

Review & act

Admin reviews the image & remarks and decides: **discard**, move to storage, or return to use.

● In Use

● In Storage

● Defective

● Discarded

Everything is retained on the record: deployment details & image, current assignment & location, current/defect images, remarks, and the Admin action — a full, traceable lifecycle.
