

## Seating & Asset Management, end to end

A one-page map of the two everyday flows: managing **where people sit** and tracking **the things the office owns**. Follow the numbered stages left to right. Chips show *who* does each step.

### Admin

- Manages floor plans, seats and layout
- Sets floor **Properties** — area & cost
- Approves / rejects seat requests
- Assigns department colours
- Runs assets, movements & verification

### Employee

- Views their own seat & the floor map
- Requests a seat **change** or **swap**
- Books meeting rooms
- Tracks the status of their requests
- No admin or approval controls

Switch roles any time from the **Admin / Employee** toggle in the top bar.

### MODULE A Seating & Workplace

From an employee's seat request to the map updating — and everything Admin controls around it.

1

EMPLOYEE

#### See my seat

Open **My Seat** to view your current seat, floor and zone — or find it on the floor map.

2

EMPLOYEE

#### Request change / swap

Ask for a vacant seat, or a swap with a colleague. Add a reason and remarks, then submit.

3

SYSTEM

#### Admin notified

The request lands in Admin's **Seat Requests** inbox and an email-style alert is sent.

4

ADMIN

#### Approve or reject

Admin reviews the details. **Approve** and the map updates automatically; **reject** with a reason.

5

EMPLOYEE

#### Seat updates

On approval the seat is reassigned (swaps exchange both) and the employee is notified of the outcome.

**Admin also runs the floor directly.** Allocate, move, block or maintenance any seat · edit the layout (rooms, walls, seats) · set **Floor Properties** (carpet + super built-up area, rental, maintenance, overhead & misc cost) · colour the map by **department** · and track **Meeting Rooms** — availability, bookings, a utilization chart, and a “still using this room?” prompt that frees idle bookings.

● Vacant ● Occupied ● On notice ● Maintenance ● Blocked

## **MODULE B Asset Lifecycle**

Every physical asset is QR-tagged and tracked from onboarding through moves, checks and disposal.

1

ADMIN

### Register & tag

Each asset is added to the **Register** with a generated QR code and a printable label.

2

ANYONE

### Scan to open

Scan the QR to open the asset **passport** — identity, location, custodian, photos and full timeline.

3

AI + ADMIN

### Verify condition

Monthly check: AI suggests a condition & confidence; Admin accepts, remarks or flags for repair.

4

ADMIN

### Move (governed)

Request → AI condition suggestion → approve → in-transit → **receipt scan** updates the location.

5

ADMIN

### Analyse

**Asset Analytics** rolls up value, category, condition and verification compliance.

● New / Good ● Fair ● Damaged / Beyond repair ● AI-assisted step

**AI moments are assistive, not automatic.** The system suggests a condition and highlights a changed area — a person always makes the final call.
